

Inline markup

Markup reads the inline markup of Markdown and draws each part in its own font: **bold**, *italic*, ***bold italic***, code and [links](#). A word keeps the punctuation after it, as in *this*, and a mark with no match, such as the one in 2 * 3, is text.

A backslash makes a mark text too: **not italic**. Code keeps its marks as they are, as in a*b*c, and a link can have emphasis in it: [the **PDFjet** repository](#).

1. Markup.paragraph makes one paragraph of a text.
2. Markup.paragraphs makes one of each part between the empty lines.
3. The paragraphs go in a **TextFrame** or a **TextColumn**, as any others do.
